SYNCHRONICITY / ELECTRIC LAND

Control the Right Parcel
Before You Buy Certainty

A full operating and AI-automation blueprint for the option-led assignment model

- **Demand hypothesis first.**
- **Exact APNs second.**
- **Cheap, assignable control only after fatal screens.**
- **Buyer-funded advanced diligence.**

Prepared for a 22-year-old solo founder in law school
Arizona launch context | 31 August 2026 | Confidential founder working document
Business strategy only. Verify legal, title, utility, engineering, tax and environmental matters with qualified professionals.

VERDICT FIRST

Is the first step to identify a parcel?

No - not as an isolated act, and definitely not as the first place you spend money.

THE CORRECT STARTING SEQUENCE
In the first two weeks, run three workstreams in parallel: (1) a fixed-scope Arizona legal-structure review, (2) 8-12 buyer-discovery conversations that produce a versioned requirement card, and (3) an automated node refresh. Parcel discovery begins immediately inside workstream 3, but a parcel is not promoted to an option candidate until the first two workstreams have shaped the search.

Why parcel-first fails

A parcel can look attractive because it is near a substation, has industrial zoning, or is cheap. None of those facts proves the parcel fits a buyer's live load, can be served on the buyer's schedule, or can be marketed lawfully through your contemplated option structure. The prior Arizona screen proved the danger: 255 infrastructure candidates produced 166 private-land signals, but 248 had unknown capacity, 181 had overlapping utility territories, and the records were points rather than exact purchasable APNs. [P1-P8]

Start with a **hypothesis**, not certainty: a 10-25 MW first phase, a possible 50 MW expansion path, low-water cooling, 40-120 usable acres, and an Arizona location are the initial search box until buyers correct it.

Start the parcel pipeline now, but label every result **NODE LEAD ONLY** until exact APN, owner, boundary, jurisdiction and access are supported by official records.

Do not pay an option fee until counsel approves the intended assignment/marketing structure, the seller can authorize diligence, the exact serving-utility intake path is identified, and at least one buyer class plausibly fits.

The initial business objective is not to prove that a site is powered. It is to create a cheap, exclusive and transferable right to investigate and present one unusually relevant site to funded counterparties.

CURRENT VERDICT
CALL SPRINT / HOLD MONEY. Up to $2,500 may be used for a fixed-scope legal memo, essential parcel/title data and limited demand discovery. Recommended current spend is $0 for an option fee, generic electrical report or formal utility study.

WHAT THE COMPANY ACTUALLY DOES

The option-led assignment model in one sentence

THE MODEL
Find a buyer-shaped parcel, secure cheap and assignable conditional control, assemble only the evidence that changes the next decision, and transfer the contractual position to a funded developer before Synchronicity must close on the land or finance major utility and field studies.

What you own

A time-limited contractual right against a specific seller, with access, inquiry and cooperation rights.

A permissioned, dated evidence room tied to exact APNs and a defined load hypothesis.

A record of which buyer objections, utility processes and local constraints were verified or remain unknown.

What you do not own

Utility capacity, a queue position, an energization promise, an entitlement, a water supply or buyer interest.

The right to market another person's land as an agent, unless the structure and conduct comply with applicable licensing law.

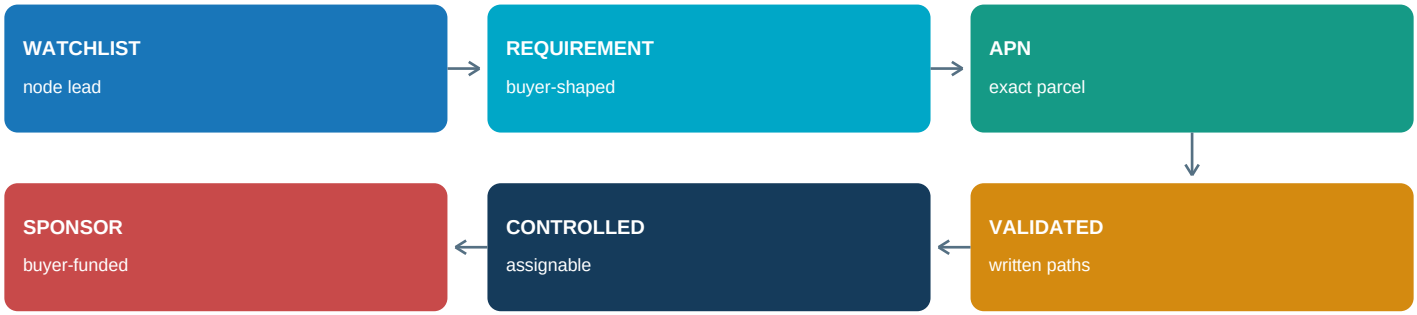

Professional engineering, title, environmental, water or legal conclusions merely because you summarized them.

Counterparty	Leverage created	What remains outside your control
Seller	High if exclusive, assignable and long enough	Authority, title cure, cooperation and extension decisions
Buyer	Medium only if parcel matches live requirements	Substitutes, timing, price, diligence threshold and capital
Utility	Very low	Delivery, supply, upgrade cost, queue credibility, tariff and timing
County/city	Low	Entitlement discretion, hearings, politics, referendum and conditions
Consultants	None	Scope, assumptions, reliance, cost and professional opinion

LEVERAGE TEST
If a buyer can replace your parcel cheaply, the option is weak. Leverage comes from a scarce combination of control, timing, exact buyer fit, credible process evidence and a seller price that leaves room for the buyer - not from the word 'option.'

OPERATE A FUNNEL, NOT A TREASURE HUNT

The deal state machine

ANY STATE -> HOLD OR KILL Preserve the reason as training data. An AI score can prioritize a call; it cannot override a fatal flaw.

State	Minimum evidence	Founder action	Money rule
WATCHLIST	Current node signal and source	None	$0
REQUIREMENT-QUALIFIED	Versioned buyer card	Discovery calls	Within $2,500 cap
APN-QUALIFIED	Exact parcels, owner, jurisdiction, access proxy	Assessor/planning clarifications	$0 option fee
PRE-SCREENED	Fatal desktop, utility intake route, seller reachable	Calls and written follow-up	Still no hard money
CONTROLLED	Counsel-approved assignable instrument	Negotiate/sign	Within $15,000 cumulative cap
SPONSOR-BACKED	Serious buyer and approved evidence budget	Pitch/negotiation	Advanced work buyer-funded
MONETIZED	Assignment/JV/close completed	Approve closing	Reinvest only after review

ONE LIVE DEAL RULE
Until the first monetization, maintain one primary opportunity and two unpaid backups. A new attractive lead does not justify a second paid-control position unless the first is killed or a written exception explains the time-sensitive advantage.

USE THE OLD SEARCH AS A NODE GENERATOR

What must change in the Arizona automation

255	166	248	181
infrastructure points	private-land signals	capacity unknown	utility overlaps

The old system did valuable work

It combined EIA, transmission, substations, land ownership, water regulation, broadband proxies and political priors into a reproducible statewide screen.

It correctly refused to convert kV into available MW and recorded source failures instead of filling gaps with estimates.

It exposed the real information asymmetry: capacity, utility assignment, owner willingness, exact parcel boundaries and local institutional knowledge were missing.

But it ranked the wrong unit of decision

Old object	Problem	Required replacement
Plant/substation point	May sit on a non-acquirable or irrelevant polygon	Exact APN polygons in rings/corridors around the node
Private land class	Does not identify owner, legal parcel or authority	Assessor record plus title/escrow verification
Territory overlay	181/255 overlaps; not a service determination	Official utility/county confirmation for exact APN
Composite score	Can average away a fatal flaw	Fatal gates first; score only surviving parcels
Water 20/20	Means less regulation, not water availability	Rights/provider/basin/path for the exact parcel and design
Broadband count	Census-block proxy, not diverse fiber routes	Provider route/budget inquiry after parcel selection

DO NOT AUTO-PROMOTE THE OLD TOP THREE
Cholla, Springerville and Coronado were strong node signals in the July screen, but subsequent research showed incumbent owners pursuing repowering or continued facility plans. They are not verified purchasable parcels. Treat every historical rank as a lead to recheck, never as an acquisition recommendation. [P1]

STEP 0A - DEFINE THE BUYER-SHAPED SEARCH BOX

Requirement Card v0 - a hypothesis to be corrected by buyers

Field	Starting hypothesis	What discovery must validate
Buyer/use	Powered-land or merchant data-center developer	Who can buy control and fund studies before an end tenant
First phase	10-25 MW	Minimum project size that matters; phased service appetite
Expansion	Path to about 50 MW	Whether buyer needs 50, 100 or 300+ MW ultimate
Timing	24-48 month service hypothesis	Actual COD window and acceptable staged energization
Land	40-120 usable contiguous acres plus expansion	Density, setbacks, substation/yard needs and ordinary-use downside
Cooling/water	Air-cooled or low-water posture	Peak and annual acre-feet; fire flow; discharge
Fiber	Two constructible diverse routes	Carrier, latency market, diversity and build cost
Power quality	High load factor; redundancy buyer-defined	Voltage, redundancy, outage profile, ramp and power factor
Control	Assignable option/phased PSA	Minimum term, diligence rights, assignment and seller cooperation
Geography	Arizona first	Counties/utilities accepted, political tolerance and travel burden
Price	Unknown	Buyer basis metric and maximum land/control premium

Versioning rule

Save every change as Requirement Card v0.1, v0.2 and so on. Record who supplied the information, whether the source was a buyer, adviser or public signal, and when it expires. A hypothesis becomes validated only after several consistent buyer conversations or a specific funded requirement.

SEARCH DISCIPLINE
Do not search simultaneously for data centers, hydrogen, crypto mining, battery factories, logistics parks and every other load. One first-deal card keeps parcel rankings comparable. A second buyer card should be opened only if discovery shows a distinct, reachable buyer class with materially different requirements.

THE 90-DAY LAUNCH SEQUENCE

Parallelize learning; serialize spending

DAYS 1-14
legal + demand + nodes

DAYS 8-30
exact APNs

DAYS 21-60
written validation

DAYS 45-90
soft control + buyer test

Window	AI / research work	Founder work	Promotion gate
Days 1-5	Rebuild source registry; refresh buyer signals and nodes	Send legal scope; book buyer calls	Counsel issue list + Requirement v0
Days 6-14	Extract buyer requirements; rank 20 nodes	Complete 5-8 discovery calls	One search card; 10 nodes survive
Days 8-21	Convert top 3 nodes into 20-40 exact APNs	Resolve assessor/GIS ambiguities	3-6 APN-qualified parcels
Days 15-30	Fatal desktop; owner and ordinary-use downside	Call planning/utility intake; contact owners	One primary + two backups
Days 30-60	Update ledger from written responses	Seek seller authorization/exclusivity	Studyable path + receptive seller
Days 45-75	Prepare anonymous buyer fact pattern	Buyer fit calls; negotiate counsel-led terms	Buyer interest or clear proof threshold
Days 60-90	Build permissioned data room	Sign only if gates clear; seek sponsor funding	Controlled, marketable position or kill

THE FIRST 90-DAY WIN
The win is not necessarily an assignment. A valid early win is one counsel-approved structure, one validated buyer card, one exact parcel pipeline, one seller-authorized written utility path and a disciplined kill before $2,500. A paid option without these is not progress.

STEP 0B - MAKE THE EXIT LAWFUL BEFORE BUYING CONTROL

Fixed-scope Arizona counsel assignment

Ask for a written issue memo, not a vague consultation

Question	Why it matters	Required deliverable
Own-property/licensing	Arizona broker definitions include options; exemptions have conditions	Opinion on LLC activity, repetition, marketing and compensation
Assignment disclosure	Residential wholesaling statute is not blanket clearance for industrial land	Seller/buyer disclosure language and role description
Entity/registration	A Delaware LLC may need Arizona registration depending on activities	Entity/SPV and foreign registration recommendation
Marketing process	Public advertising can create licensing, confidentiality or misrepresentation risk	Approved teaser, NDA, buyer-list and broker/channel rules
Escrow/tax	Assignment, SPV sale, double close and option exercise differ	Permitted structures, closing flow and tax questions to escalate
Control form	Assignment, memorandum, remedies and access are jurisdiction-specific	Counsel-drafted term sheet/form and title/escrow coordination

Scope email

```
Subject: Fixed-fee Arizona option-assignment structure review

Synchronicity plans to acquire its own conditional option or phased purchase interest in one Arizona industrial parcel,
investigate it with seller authorization, and potentially assign or transfer the position to a funded developer. Please
quote a fixed-fee memo/call addressing licensing and own-property treatment, assignment marketing, required disclosures,
entity registration, escrow/closing alternatives, memorandum/recording, and the business terms a counsel-drafted
instrument must contain. We will not market, sign or pay consideration until the recommended structure is documented.
```

STOP CONDITION
If counsel says the contemplated repeated assignment model cannot be operated safely without a broker, licensed partner or materially different structure, stop parcel spending and choose that lawful structure before proceeding. Do not self-interpret the statutes because you are in law school.

STEP 1 - DISCOVER DEMAND BEFORE PITCHING INVENTORY

Eight to twelve conversations create the search specification

Target order

Priority	Counterparty	Why first	What to learn
1	Growth-stage powered-land / merchant developers	Can evaluate imperfect positions and fund next proof	Live markets, MW blocks, required control and utility evidence
2	Specialist data-center land brokers and site selectors	See many rejection patterns and buyer mandates	Basis metrics, substitutes, process and lawful channel role
3	Infrastructure investors / development capital	Can back diligence when the fact pattern fits	Sponsor threshold, downside protection and governance
4	Regional operators / conversion platforms	May accept smaller first-phase projects	Timing, facility type, fiber/water and expansion needs
5	Hyperscalers	Large demand but high procurement and in-house capacity	Use only through warm channels or a uniquely mature position

Discovery opening

USE THIS
I am building a disciplined pipeline of exact-parcel, seller-controlled sites for phased large loads. I am not pitching a parcel today. Before I search, I want to understand what causes your team to reject a site and which written evidence makes you willing to inspect a controlled position. What would a 10-25 MW first phase with a possible 50 MW expansion need to show?

Questions in order

Which markets and serving utilities are currently acceptable or excluded?

What first-phase, ramp, ultimate MW and service date are actually live?

What kills a site immediately: power timeline, water, fiber, land use, price, access, emissions, noise, ownership or politics?

Which utility artifact is enough for an initial site review, and which work must wait for your credit and load profile?

What option term, assignment right and seller cooperation must already exist?

Will you reimburse or directly fund a next utility/engineering proof if the early fact pattern fits?

May I return with a matching anonymous one-pager, and who else should review it?

TURN CONVERSATIONS INTO A REUSABLE BUYER DATASET

Do not confuse a polite call with validation

Examples from the 100-customer research

The earlier prospect universe identified developers such as Tract, PowerHouse Data Centers, Rowan Digital Infrastructure, CleanArc, Corscale, Crane Data Centers, Ada Infrastructure, Takanock and Beale Infrastructure as more plausible learning targets than direct hyperscaler outreach. None has been contacted or represented as interested. [P12]

Capture field	Required entry
Person and role	Decision maker, developer, operator, adviser, broker, capital source or unknown
Requirement status	Live/funded, exploratory, stale, confidential or no requirement
Load and timing	First phase, ramp, ultimate MW, service window and flexibility
Land/cooling/fiber	Acres, water target, routes, latency, emissions/noise and expansion
Control threshold	Minimum term, assignment/nominee rights, access and seller authorization
Evidence threshold	Exact utility, zoning, title, civil/environment, reliance and freshness
Commercial form	Buy, ground lease, option assignment, JV, reimbursement or no preference
Follow-up	Permission, next person, date, document promised and explicit objections

Validation standard

One buyer saying 'interesting' is V2 at most and does not justify an option.

Three or more consistent conversations can shape the requirement hypothesis, but site-specific engagement still requires a dated communication.

A buyer willing to sign an NDA, inspect a data room, identify a decision maker or fund the next proof is materially stronger than a generic compliment.

FOUNDER CREDIBILITY
Your strongest positioning is not 'I know the grid.' It is: 'I control very few positions, separate public signals from parcel-specific proof, preserve every unknown, and ask licensed specialists only the question that unlocks the next decision.'

THE AI OPERATING SYSTEM

Automate research and state management; hand off judgment and authority

Human approval boundary

AI may research, extract, rank, draft and monitor. The founder or qualified professional calls, signs, represents, visits, certifies and spends.

Recommended MVP stack

Start with a local, reproducible pipeline rather than custom SaaS. The first system can run from Python, GeoPandas/Shapely, SQLite or GeoPackage, Parquet/CSV, a structured-output language model and a secure document folder. Add PostGIS, a web application and paid data only after the workflow produces a real controlled opportunity.

Layer	MVP	Upgrade trigger
Geospatial	GeoPackage + GeoPandas	More than 10 states, large rasters or multi-user editing
Deal database	SQLite + JSON records	Multiple analysts or concurrent transactions
Evidence files	Stable folders + hashes + ledger	External data-room access or formal permissions
AI	Structured extraction and drafting	Only after tests show repeatable accuracy and cost
Scheduling	One weekly scout + event-triggered updates	More frequent only when a live option needs monitoring
Interface	Generated HTML/PDF summaries	Build a dashboard after the schema stabilizes

DESIGN PRINCIPLE
The automation should be optimized for fast falsification, not for finding the highest score. It should tell you which $0 call or public record can kill a parcel next, and it should make it impossible for an unknown capacity field to become zero or a fabricated MW number.

AUTOMATION INPUT MAP - LAND, OWNERSHIP AND POWER

Every adapter has a source, scope, freshness rule and failure state

Domain	Primary source	Automated use	Cannot prove
Generator status	EIA-860M / EIA-860	Current and planned retirement/change leads	Load-serving capacity or owner willingness
Transmission/substations	Utility plans, ACC filings, HIFLD-style layers	Node and corridor signals; voltage/distance	Available MW, upgrade scope or delivery date
Retail territory	Utility/ACC maps and county confirmation	Candidate provider list	Exact serving utility where polygons overlap
Parcel geometry	County assessor/GIS; AZGeo index	Exact APNs, acreage, adjacency, owner-of-record fields	Marketable title, legal access or authority
Recorded documents	County recorder / title company	Document numbers and access/easement leads	Title conclusion without professional review
Land ownership class	BLM/ASLD/tribal layers	Early public/state/tribal exclusion or alternate path	Exact fee owner or transaction authority
Listings/comps	Authorized listing feeds; assessor sales; manual review	Seller signal and ordinary-use downside	Seller willingness, clean price or option terms

Adapter contract

```
source_id | publisher | URL/API | scope | fields | retrieved_at | effective_date
license_or_terms | rate_limit | last_success | last_failure | checksum | freshness_due
transform_version | geometry_CRS | known_gaps | manual_fallback
```

Do not silently substitute a stale annual source when a monthly source fails. Record the failure and downstream fields affected.

County parcel adapters are jurisdiction-specific. A statewide search catalog may help discover layers, but the county assessor/recorder remains authoritative for the transaction workflow.

Respect access controls, rate limits and terms. Do not scrape behind logins or bypass anti-bot restrictions; create a manual task instead.

SOURCE REGISTRY

Automation input map - use, water, environment and connectivity

Domain	Primary source	Automated screen	Human/professional escalation
Zoning/use	County/city GIS, adopted code, agendas and case files	Current zone, overlay, future use, moratorium/ordinance alerts	Written use determination, pre-app and local counsel
Water	ADWR GIS/GWSI, AMA/INA, provider layers	Basin, wells, regulatory regime, subsidence/fissure leads	Rights, provider capacity, hydrology, permit and cooling plan
Flood	FEMA NFHL / Map Service Center	Current mapped flood zone and panel status	Survey/civil interpretation and unmapped drainage
Species/habitat	USFWS IPaC and critical habitat data	Species/resource list and consultation lead	Biologist and formal consultation determination
Environmental facilities	EPA ECHO/FRS plus ADEQ	Nearby regulated/legacy facility indicators	Phase I ESA and targeted investigation
Cultural/tribal	Official cultural/tribal screens where public	Proximity/consultation trigger	Qualified archaeologist, tribes and agency process
Road/rail	State/local DOT and official GIS	Frontage, route, bridge and corridor proxies	Access rights, traffic/civil feasibility
Fiber	FCC availability plus provider maps	Provider/technology proxy	Route, diversity, construction and budget letter

SOURCE FRESHNESS
Recheck contacts, buyer requirements, listings, utility tariffs/dockets and ordinances on the day they drive a decision. Recheck political and moratorium status weekly before control. Environmental and physical facts may be older only when their scope and effective date remain clear.

AI MODULE 1 - MARKET AND NODE SCOUT

Find places worth parcelizing, not parcels worth buying

Inputs

Requirement Card version and weights.

Current buyer signals and explicit geographic exclusions.

Utility/regulator planning materials, tariffs, queues/process statements and large-load filings.

EIA-860M retirement/addition changes, high-voltage node/corridor layers, industrial land signals and founder closeability.

Process

Pass	Automation action	Output
1. Change detection	Compare source hashes, dates, dockets, outages and company signals	Only materially changed facts
2. Market rank	Score utility transparency, demand, politics, water posture and closeability	3 markets with evidence coverage
3. Node generation	Create buffers/corridors around plausible infrastructure and brownfields	20-50 node leads
4. Cheap exclusions	Remove non-acquirable land classes, impossible geography and explicit bans	10-20 leads
5. Falsification rank	Sort by conservative fit and cheapest next proof	1 primary node + 2 backups

Node lead record

```
node_id, requirement_version, geometry, node_type, voltage_signal, utility_candidates,
land_classes, jurisdictions, buyer_signal, evidence_coverage, contradictions,
next_cheapest_test, status='NODE_LEAD_ONLY', retrieved_at
```

FORBIDDEN OUTPUT
The node scout may never output 'available MW,' 'powered site,' 'utility approved,' 'shovel-ready' or a success probability. It may say only that a current source creates a reason to investigate exact parcels.

AI MODULE 2 - CONVERT NODES INTO EXACT APNS

This is the first true land-search step

Geospatial sequence

Order	Action	Quality test
1	Fetch the authoritative county parcel layer around each node/corridor	Layer date, county provenance, CRS and unique APN field recorded
2	Generate rings/corridors from parcel boundaries, not from ownership-class polygons	Distances measured in a suitable projected CRS
3	Join assessor owner-of-record, mailing address, acres and last sale where lawful	Nulls preserved; no invented contact data
4	Assemble contiguous parcels and expansion paths	Show every APN and assemblage dependency
5	Intersect jurisdiction, zoning, land class, roads, flood, water and environmental screens	Exact parcel applicability stored per claim
6	Estimate ordinary-use downside using zoning, access and comparable sales	Label as screen, not appraisal
7	Create owner-reachability task and title/recorder document list	Assessor record is not title proof

Promotion test - NODE LEAD to APN-QUALIFIED

Exact APN and boundary source are captured.

Owner of record and transaction-authority questions are identifiable.

Parcel is large/usable enough for the requirement hypothesis or has a realistic assemblage.

Legal access is not disproved; jurisdiction and land class are known.

The land has a plausible ordinary use and price basis if the electric thesis fails.

OWNER DATA RULE
Public owner records are used only for legitimate transaction diligence. Secure the data, avoid publishing personal information, and verify authority through title/counsel before relying on it.

AI MODULE 3 - EXACT-PARCEL FATAL-FLAW SCREEN

Kill before scoring

Fatal gate	Pass standard before paid control	Cheapest falsification
Exact parcel	Official APN/boundary and usable configuration	County GIS/assessor
Owner/authority	Reachable owner; authority can be verified	Assessor/entity search; seller call
Access	Recorded/public or plausible curable access	Recorder/title desktop
Serving utility	Exact APN has a defined verification route	Utility/county written confirmation
Power process	Utility will accept a credible screening/application path	Intake call; process document
Use path	No ban; by-right, CUP or feasible rezoning path	Code + planning confirmation
Water/cooling	Lawful low-water path plausible	ADWR/provider screen
Environment/civil	No known fatal flood, habitat, contamination, cultural or ROW issue	Official desktops; Phase I scope later
Control transfer	Seller will consider assignment/nominee and diligence rights	Seller discovery; counsel
Lawful marketing	Counsel-approved role, process and disclosure	Written legal memo
Buyer class	At least one validated class plausibly fits	Requirement card + discovery notes
Capital	Next gate is within cap or sponsor-funded	Spend request

RULE
An unresolved gate is not always a kill at scan stage. It is a reason to withhold money and name the fastest test. A contradicted gate is a stop unless a specific cure path is documented.

RANK SURVIVING PARCELS BY EVIDENCE AND FALSIFICATION VALUE

A score is not a probability

Dimension	Weight	A high score requires
Power path	25	Current parcel/load-specific delivery, supply, upgrade and process evidence
Buyer fit	20	Qualified buyer confirms requirement and proof threshold
Land/control/downside	15	Usable parcel, accessible owner, transferable control and ordinary-use value
Permitting/politics	10	Predictable use path and manageable opposition
Fiber	10	Two constructible diverse routes supported by provider/engineering
Water/cooling	5	Low-water design and lawful source/discharge path
Civil/environment	5	Clean fatal screens and manageable site work
Economics/carry	5	Buyer value after price, upgrades and carry; evidence transfers
Execution/closeability	5	Founder can transact with accessible professionals and counterparties

Four outputs, never one

Conservative score: unknown critical facts fail.

Base score: documented analyst judgment.

Upside score: explicitly identifies which unknowns would have to pass.

Evidence coverage: weighted share supported by acceptable parcel-specific evidence.

Decision priority formula

```
priority = conservative_fit + evidence_coverage + buyer_relevance
- fatal_risk - founder_friction - next_test_cost - time_to_answer
```

PROBABILITY DISCIPLINE
Before an exact parcel and qualified buyer requirement, success probability is not estimable. After control, forecast separate ranges for utility path, entitlement, buyer engagement and closing. Do not convert the composite score into a deal probability.

THE MACHINE-READABLE DEAL RECORD

Every claim must know what it applies to

```
{
'deal_id': 'EL-001',
'as_of': '2026-08-31',
'state': 'WATCHLIST',
'requirement_version': 'DC-AZ-v0.1',
'parcels': [{'apn': null, 'boundary_source': null, 'owner_verified': false}],
'utility': {'candidate': null, 'verified': false, 'available_mw': null},
'fatal_gates': {'exact_parcel': false, 'owner_authority': false,
'access': false, 'serving_utility': false,
'power_process': false, 'use_path': false,
'water_path': false, 'environment': false,
'transferable_control': false, 'lawful_marketing': false,
'buyer_class_fit': false, 'capital_path': false},
'control': {'instrument': null, 'assignable': null, 'term_days': null},
'capital': {'spent': 0, 'committed': 0, 'next_request': 0},
'verdict': 'HOLD / RESEARCH'
}
```

Evidence record

```
claim_id, deal_id, apn, exact_claim, source_url, publisher, effective_date,
retrieved_at, evidence_class, exact_parcel, scope, expiration, contradiction,
owner, archived_hash, confidentiality, reliance_rights, next_verification
```

Evidence grades

Grade	Meaning	Example
V4	Executed / parcel-specific official or professional	Signed option, utility study, zoning letter, title/Phase I
V3	Current official public record	Assessor, adopted code, tariff, official GIS
V2	Reliable secondary source or documented call	Professional report, dated founder note
V1	Proxy, inference or seller claim	Line proximity, listing, seller says 'power'
V0	Unknown or conflicting	No reliable evidence

THE HUMAN APPROVAL BOUNDARY

AI should remove work, not manufacture authority

AI may	Founder must	Professional must
Retrieve public data and log failures	Approve sources and priorities	Confirm regulated/professional scope
Run spatial joins and rank next tests	Resolve ambiguous APNs and make calls	Survey/title/engineering conclusions
Extract ordinances, dockets and terms	Read decisive source text and correct extraction	Give legal or utility opinions
Draft scripts, emails and term issue lists	Send, negotiate and represent facts	Draft/review contracts and disclosures
Monitor changes and create reminders	Choose timing around law school	Manage filing and professional deadlines
Prepare evidence summaries and data rooms	Approve sharing and confidentiality	Grant reliance/assignment rights
Model scenarios	Authorize any spend	Provide quotes, appraisals and tax advice

Mandatory automated checks

Reject any record that contains available MW without a current exact-parcel utility artifact.

Reject a parcel without exact APN and boundary source from moving to paid control.

Reject an option recommendation if assignment, seller authorization, term, legal review or capital cap is unresolved.

Flag sources past freshness deadlines and show contradictions before the score.

Generate a human task rather than guessing when a website fails, a polygon overlaps, or an official answer is missing.

AUDIT RULE
Every AI-written sentence in a buyer-facing packet must trace to a claim ID. If the source cannot be produced immediately, the sentence is removed or labeled as an unresolved hypothesis.

PROMPT PACK I - RECURRING MARKET AND NODE SCOUT

Use structured outputs; save only deltas

```
ROLE: Electric-land sourcing analyst.
OBJECTIVE: Find current node leads for Requirement Card [VERSION], then identify the cheapest next falsification.

RULES:
1. Use current primary sources first and date every mutable fact.
2. A plant, line or substation is a node lead, never a parcel.
3. Never infer MW from voltage, distance, retired nameplate or a territory polygon.
4. Use null for unknowns. Show source failures and contradictions.
5. Penalize founder travel, opaque utilities and difficult transaction systems.
6. Return one primary node, two backups and a kill list.

OUTPUT JSON:
{requirement_version, as_of, changed_sources, node_leads:[{node_id, geometry,
why_now, buyer_fit, utility_candidates, land_classes, evidence_grade,
contradictions, next_cheapest_test, source_ids}], killed:[{node_id, reason}]}
```

Evaluation tests

Test	Pass condition
Unknown-capacity test	No non-null MW unless an exact supporting source is linked
Point/parcel test	Every node record says NODE_LEAD_ONLY
Freshness test	Mutable sources include retrieval date and next review date
Contradiction test	Conflicting owner/utility/political facts are surfaced, not silently selected
Capital test	No spend request appears at node stage

SCHEDULE
Run weekly while no parcel is controlled. Once a live option exists, continue only the primary deal plus two backups; node scouting becomes a short change alert unless the primary is killed.

AUTOMATION PROMPTS

Prompt pack II - exact parcel and document analyst

```
TASK A - PARCELIZE
For node [NODE_ID], retrieve the authoritative county parcel layer and generate exact APNs in engineering-relevant
rings/corridors. Preserve boundaries, acres, owner-of-record fields, jurisdiction, land class, access proxies, adjacency
and source date. Do not treat the node parcel as the target automatically. Return APN candidates and missing records.

TASK B - DOCUMENT EXTRACT
Read [ORDINANCE/DOCKET/TARIFF]. Extract only explicit claims into the evidence schema: controlling section, effective
date, geography, exact use, decision body, filing/hearing path, costs/deposits, conditions, expiration and contradictions.
Quote no more than necessary. Mark legal interpretation unresolved.

TASK C - DEAL UPDATE
Merge founder call notes and new documents into Deal [ID]. Do not overwrite prior facts; version them. Recompute fatal
gates, evidence coverage, next cheapest test, authorized spend and verdict. Return only changed decisions and founder
actions.
```

Founder handoff output

```
action_id | owner | verified contact channel | decision unlocked | deadline/timezone
full script | voicemail | priority questions | evasive follow-ups | documents open
capture form | success | partial success | stop outcome | reminder requested
```

CONTACT SAFETY
The system must recheck any phone number, email, contact role and office on the day a call packet is created. It should never schedule a reminder around an unverified contact or claim the call was made.

RECURRING AUTOMATION CADENCE

One scout, one deal update and one founder call block

Cadence	Automation	Founder output	Noise rule
Weekly scout	Refresh mutable sources; identify material changes	One paragraph if nothing changed	No repeated full report
Weekly qualification	Parcelize/rank the best open node or deepen primary	One primary decision plus backups	Do not open paid deal #2
Founder call block	Generate scripts, documents and capture forms	60-90 minutes of calls	Batch calls around school
After call notes	Immediate UPDATE mode; revise gates and ledger	Approve changed next step	Do not wait for weekly run
Material gate change	Regenerate deal packet and data room index	Review and authorize	No cosmetic duplicate PDFs
Monthly retro	Measure false positives, cost, cycle time and missed data	Choose one workflow change	Do not redesign everything

Durable recurring instruction

```
Continue the highest-value open electric-land deal in this conversation. Work demand-first, browse current primary sources, preserve exact APNs and evidence dates, and never infer capacity from proximity or voltage. Spend nothing unless the next gate names payee, deliverable, decision unlocked, reliance/transfer rights and stop condition. Give me only calls, emails, approvals and negotiations that require me. If nothing material changed, say so and name the next founder-dependent event.
```

STATE PERSISTENCE
Keep the canonical requirement card, deal JSON, evidence ledger and current verdict in persistent storage. Scheduled agents may not retain the scratch workspace; the data model, not chat memory, is the source of truth.

STEP 2 - THE FOUNDER VALIDATION SPRINT

Call in an order that makes each later conversation more credible

Order	Call	Decision unlocked	Required written follow-up
1	Assessor/GIS/planning desk	APN, jurisdiction, use path, applications and parcel history	Map, code section, case file or written direction
2	Utility economic development / large-load intake	Exact territory, credibility requirements and process	Application, tariff/process and next contact
3	Utility planning/engineering if routed	Study inputs, delivery alternatives, deposits and lead-time risks	Written summary or process acknowledgment
4	Water/wastewater provider or ADWR route	Provider/right/permit path and design limits	Map, policy, data request or named specialist
5	Fiber providers	On-net/near-net and diverse-route budget process	Route/budget process, not availability slogan
6	Title/escrow and land counsel	Access/title/control/marketing issues	Preliminary report/scope and legal issue memo
7	Seller	Goals, authority, cooperation and control terms	Data authorization or counsel-led term sheet
8	Buyer	Site-specific fit and next proof	NDA/data-room request or explicit rejection reason

Universal pre-call brief

Exact APN map and boundary source.

Target first-phase/ultimate MW and service window, labeled hypothesis.

One-sentence low-water posture and founder/company identity.

Blank capture form and the exact decision the call must unlock.

HONEST POSITIONING
I am screening a specific parcel for a phased electricity-intensive development. I am not asking you to reserve capacity or make a commitment. I want to understand the correct process, the evidence a credible applicant must provide, and whether there is a studyable path before I spend money or represent anything to a buyer.

UTILITY CALL PACKET

Ask for the process, not a promised MW number

OPENING
Hi, my name is William Ernst with Synchronicity. I am evaluating APN [APN] in [JURISDICTION] for a prospective [10-25] MW first phase with a possible [50] MW ultimate build. I am still in feasibility and will not describe the parcel as powered without written utility support. Can you confirm whether you serve this exact APN and route me to the correct large-load intake or system-planning process?

Priority question	Why it matters
Do you serve this exact APN? If not, how can I verify the boundary?	Prevents a territory overlay from becoming a false fact
What distinguishes a credible request from a speculative one?	Arizona utilities are screening large queues [W1-W5]
Can an option holder request preliminary screening, and what owner authorization is required?	Determines whether soft control unlocks the next step
What application, deposit, study, confidentiality, collateral and milestone sequence applies?	Defines capital and document gates
Can service be phased, and how are ramp assumptions tested?	Matches the buyer card and minimum-bill risk
How are delivery upgrades, energy supply/generation, line extension and tariff/credit handled separately?	Prevents one vague 'power' answer
What fact would cause you to reject or pause this request today?	Finds the cheapest kill

Follow-up email

```
Subject: APN [APN] - request for correct large-load screening process

Thank you for speaking with me on [DATE]. My understanding is: [BULLETS]. Please correct anything inaccurate. I will not
represent available capacity or timing based on this conversation. Would you send the current application/tariff/process,
confirm the owner-authorization requirement, and identify the next technical contact?
```

PLANNING, WATER AND FIBER CALL PACKETS

Turn institutional knowledge into dated evidence

Planning/zoning

Opening: *I am screening APN [APN], not requesting an approval. Could you confirm the parcel's jurisdiction, current zoning and future land-use designation, and whether a [data center / high-load industrial use] is by right, conditional, special-use, rezoning or prohibited?*

Ask for the controlling use definition and code section, not a staff impression.

Ask about active applications, overlays, setbacks, height, noise, generators, water/cooling restrictions, moratoria and proposed ordinances.

Ask which body decides, expected pre-application/hearing sequence, referendum/appeal exposure and comparable opposition.

Water/wastewater

Opening: *I am screening APN [APN] for a low-water electricity-intensive facility. I need the governing provider or regulator and the written path, not a service promise. What source, right, permit or service process applies?*

Ask peak day and annual acre-feet, cooling restrictions, drought curtailment, fire flow, discharge/reuse and provider connection capacity.

Separate legal rights from physical infrastructure and water quality.

Fiber

Opening: *Can your network team confirm whether APN [APN] is on-net or near-net and explain the budgetary process for two physically diverse entrances and routes? Provider availability alone is not enough.*

Ask route diversity, conduit/ROW, distance, lit/dark fiber, carrier-hotel path, latency, lead time, non-recurring cost and transferability of any letter or quote.

STEP 3 - APPROACH THE SELLER AFTER CHEAP SCREENS

Do not promise a buyer or hide uncertainty

SELLER OPENING
I am evaluating whether the property could support a large infrastructure use, but utility and governmental questions remain unresolved. I am not promising a closing or asking you to rely on a buyer I do not have. I would like to understand your goals and whether a short, paid, conditional diligence period or assignable option could create a fair path for both sides.

Seller discovery checklist

Topic	Questions
Authority	Who owns the property, who signs, entity approvals, marital/probate/bankruptcy issues?
Economics	Price, timing, taxes/1031, retained acreage, lease/JV interest, carrying concerns?
History	Prior offers, studies, utility contacts, applications, contamination, water/minerals and disputes?
Control	Short exclusivity, option, extensions, assignment/nominee, access and testing?
Cooperation	Authorization for utility/planning/title inquiries and documents; confidentiality boundaries?
Conflicts	Broker/listing agreements, options, leases, rights of first refusal and neighboring claims?

What you ask for before a full option

Seller-signed data and utility authorization.

Access/right-to-test terms appropriate to the work, with insurance/restoration reviewed by counsel.

30-60 day exclusivity/no-shop if the seller will grant it for modest consideration.

Documents already in the seller's possession and permission to show an anonymous fact pattern to qualified buyers.

WALK AWAY
Pressure to conceal your assignment economics, a short forced closing, no seller authorization, disputed authority, large nonrefundable cash or confidentiality that blocks utility/buyer diligence converts leverage into risk.

STEP 4 - CLIMB THE CONTROL LADDER

Use the least expensive instrument that preserves the next decision

Instrument	Best use	Limitation
NDA + data authorization	Early owner dialogue and document access	No exclusivity or sale right
Access/right to test	Desktop and limited field diligence	No price protection unless combined
Short exclusivity/no-shop	Time to validate seller, utility and use path	Expires; remedy matters
ROFR/ROFO	Preserve future negotiation	Usually cannot force a sale at a known price
Assignable option	Asymmetric upside at a defined price	Fee, term, extensions, assignment and recording matter
Phased PSA	Mature path with diligence conditions	Deposits and deadlines can turn hard
Ground-lease option	Lower acquisition cash; seller retains land	Finance, lender, tax and assignment complexity

Counsel-drafted option business points

Exact Synchronicity/SPV entity and legal description; purchase price or transparent formula.

Target a long-enough initial term and staged extensions. An illustrative negotiation target is 6-12 months plus extensions to 18-24 months, subject to seller market and counsel - not a form or promise.

Modest staged consideration, creditable at closing where negotiated; no personal guarantee.

Express assignment, nominee and buyer-approved change-of-control path.

Access/testing, utility/government authorization, seller cooperation and document delivery.

Broad diligence/approval conditions, title/survey cure, casualty/condemnation and closing conditions.

Confidentiality that permits qualified buyer diligence; broker treatment; memorandum/recording strategy; remedies and survival.

CAPITAL GATES

Your $100,000 is a ceiling, not a budget

NOW
$2.5k
legal + demand

SOFT CONTROL
$7.5k
APN + seller authority

OPTION PROOF
$15.0k
assignable control

ADVANCED
buyer-funded
buyer funded

The unused reserve is not idle cash. It is protection against a wrong parcel, a short seller clock, and sunk-cost escalation.

Gate	Cumulative cap	Must be true	Authorized use	Stop
0 - learn	$2,500	Counsel scope, Requirement Card, APN workflow	Legal memo, calls, limited data/travel	No buyer problem or lawful structure
A - soft control	$7,500	Exact APN/owner, fatal desktop, seller receptive, intake path	Counsel, title desktop, authorization/exclusivity	Hard cash, short clock, no cooperation
B - option proof	$15,000	Assignable control, written use/utility process, buyer class	Modest option fee and decisive portable screens	Title/access/power/use/water/buyer fatality
C - advanced	Buyer-funded	Serious buyer and approved evidence budget	Utility/field studies, survey, Phase I, extension	Founder asked to fund unpriced utility exposure
Reserve	$85,000 untouched	Written exception after external validation	Second validated opportunity or closing gap	Never rescue sunk cost

Spend request form

```
amount | cumulative exposure | payee | refundable/creditable | exact deliverable
parcel and decision unlocked | reliance/assignment rights | deadline | kill criterion
what happens if answer is negative | who funds the next gate
```

STEP 5 - MANUFACTURE TRANSFERABLE EVIDENCE

The product is a controlled position plus an auditable decision room

Folder	Contents	Promotion standard
00 Executive	One-page verdict, fatal gates, unknowns and next decision	No promotional adjectives unsupported by claim IDs
01 Control	Executed agreement, amendments, seller authority, access and confidentiality	Assignment/nominee and term summarized by counsel
02 Parcel/title	APNs, legal description, boundary, assessor, recorder, title/access	Every parcel and assemblage dependency explicit
03 Utility	Territory proof, intake, tariffs/process, calls, written responses	Delivery, supply, upgrades and commercial terms separated
04 Land use/politics	Code, zoning map, applications, letters, agendas and opposition	Use path and decision calendar current
05 Water	AMA/INA, provider/rights, design demand, discharge and fire flow	Legal and physical path separated
06 Environment/civil	Flood, IPaC, EPA/ADEQ, Phase I scope, geotech/civil leads	Professional limitations and expiration visible
07 Fiber/logistics	Provider/route records, road/rail and access	No diversity claim without route proof
08 Commercial	Requirement card, buyer feedback, price basis, option economics	Confidential sources permissioned
09 Evidence ledger	Claim IDs, dates, grades, scope, conflicts and owners	Every buyer-facing sentence traceable

TRANSFERABILITY TEST
For every report or letter ask: Who issued it? Which exact parcel and load does it cover? What assumptions and exclusions apply? Can a buyer, lender or SPV rely on it? Can it be assigned? When does it expire? A beautiful report without reliance or assignment rights may add little transaction value.

DILIGENCE SEQUENCE

Buy the cheapest fact that can kill or unlock the next gate

Sequence	Evidence	Founder pays?	Decision unlocked
1	Exact APN/jurisdiction/access desktop	Yes, within Gate 0/A	Is this a real parcel?
2	Utility intake and owner-authorization requirements	Calls only	Is there a process you can enter?
3	Written zoning/use/moratorium path	Limited fee if necessary	Can the use lawfully proceed?
4	Water/flood/environment desktops	Limited, targeted	Is there an obvious fatality?
5	Buyer requirement and anonymous fact-pattern review	No project study	Does anyone value the next proof?
6	Preliminary title and survey scope	Within Gate B	Can control and access survive diligence?
7	Utility feasibility/system-impact/line-extension work	Buyer/sponsor	Delivery, supply, cost and timing path
8	Phase I, ALTA, wetlands, geotech, civil/fiber studies	Buyer/sponsor	Can a buyer/lender rely and close?
9	Entitlement and engineered design	Project capital	Can the facility be approved and built?

Consultant request

```
Please quote the least-expensive scope that can answer [DECISION] for exact APN [APN]. Separate desktop and field phases.
Identify exclusions, third-party inputs, delivery time, fee/reimbursables, seal, reliance-letter availability, assignment
to a buyer/lender/SPV, update cost, conflicts, insurance and a not-to-exceed amount. This request does not authorize work.
```

NO GENERIC ELECTRICAL REPORT
The utility's process and the buyer's load/credit profile determine whether a power study matters. A consultant can assess scope and infrastructure, but cannot create utility capacity or permission. Do not buy an untethered report merely to make the site look more certain.

STEP 6 - RUN A PERMISSIONED BUYER PROCESS

Sell the development position, not the PDF

Outreach ladder

Stage	What is shared	Buyer action that advances the deal
1. Anonymous fit check	Region, first/ultimate MW hypothesis, acres, use path, major unknowns	Confirms requirement and asks for APN-level review
2. NDA teaser	Exact APNs, control summary, source-linked fatal-screen facts	Names decision maker and review process
3. Data room	Permissioned control and evidence documents	Returns written questions or site visit request
4. Proof budget	Defined next utility/professional scope and quotes	Buyer reimburses/funds or signs exclusivity
5. Transaction	Assignment/JV/option acquisition terms	LOI, deposit and counsel process

Target list size

Build 15-25 qualified prospects that fit the same requirement card; do not blast a public listing.

Prioritize warm introductions from land counsel, title/escrow, utility economic development, engineers, land-use professionals and specialist brokers.

Approach powered-land and merchant developers before hyperscalers. The buyer must be able to carry diligence and option timing.

Use one evidence room and a consistent question deadline so buyers compare the same facts.

NO BUYER CLAIM
A buyer is not 'interested' unless a dated communication supports that statement. An NDA, data-room access, written questions, site visit, proof budget or LOI are progressively stronger evidence; a friendly call is not.

BUYER SCRIPTS AND DECISION PACKET

Make the asset carry the conversation

Anonymous fit email

```
Subject: Arizona controlled-site fit check - [PHASE] MW first phase

Synchronicity is evaluating an assignable, seller-authorized position on [ACRES] acres in [REGION] for a [PHASE] MW first
phase and possible [ULTIMATE] MW expansion. We are not representing available capacity. Current evidence addresses exact
APNs, owner/control path, serving-utility intake, land-use process and early fatal screens; [KEY UNKNOWNS] remain. Does
this fact pattern match a live requirement, and what written proof would your team require before an APN-level review?
```

One-page decision sheet

Block	Content
Verdict	Why inspect / why not / next test
Control	Instrument, remaining term, extensions, assignment, seller cooperation
Buyer card	Phase/ramp/ultimate, acres, cooling, fiber, timing and price basis
Verified	Only V3/V4 parcel-specific facts, dated
Unknown	Available MW, upgrades, cost, timing, title, entitlement and other open gates
Ask	NDA, data-room review and buyer-funded next proof
Stop date	Date control expires and when extension becomes uneconomic

Objection response

If asked, 'Do you have power?' answer: **No utility capacity is being represented. The parcel has [verified nearby infrastructure/process fact], and the serving utility has identified [written next step]. I am asking whether this merits buyer-backed feasibility, not asking you to underwrite a capacity claim.**

STEP 7 - MONETIZE WITHOUT CLOSING ON THE LAND

Choose the transaction that preserves capital and legal clarity

Path	How you get paid	Main issues
Option/PSA assignment	Fixed assignment consideration, spread or negotiated payment	Assignment consent, disclosure, brokerage, tax and escrow
Buyer acquisition of project SPV	Equity purchase price	Securities/tax/liabilities/change of control; counsel required
Buyer-funded exclusivity	Reimbursement plus negotiated transfer terms	Scope, termination, ownership of evidence and confidentiality
Development JV	Reimbursement, promote/minority upside	Securities, governance, fiduciary, capital and tax complexity
Ground-lease position	Lease-option assignment or participation	Lender rights, landlord obligations and long duration
Close and resell	Land price spread	Highest capital, title, tax, carry and market risk; not launch default

Illustrative mechanics - not a forecast

Scenario	Transfer proceeds	Reimbursed diligence	Founder cost basis	Pre-tax contribution
Low	$15,000	$0	$10,000	$5,000
Middle	$35,000	$6,000	$10,000	$31,000
High	$75,000	$10,000	$15,000	$70,000

Formula: **pre-tax contribution = transfer proceeds + reimbursed costs - option consideration - legal/title/data/diligence - extension/carry - closing costs.** These numbers illustrate mechanics only. No parcel, buyer, seller terms or market quote exists, so actual proceeds and probability are unknown.

PROFITABILITY TRUTH
The first monetization may be small, slow or zero. Early profitability depends on keeping the cost basis low and obtaining buyer funding before expensive certainty. Do not extend a dead option because its sunk cost makes a large assignment feel necessary.

CLOSING AND TRANSFER CHECKLIST

No transaction is complete because the buyer says yes

Workstream	Required confirmation
Authority	Seller, Synchronicity entity and buyer approvals; beneficial ownership and signatures
Control	Option/PSA valid, unexpired, uncured defaults addressed, assignment/nominee consent satisfied
Disclosure	Role/equitable interest, assignment economics and material facts disclosed as counsel requires
Title/escrow	Legal description, exceptions, access, liens, taxes, prorations, recording and closing flow
Evidence	Data-room index, permissions, reliance/assignment rights, confidentiality and update dates
Utility/government	No correspondence is overstated; applications/authorization transferred correctly
Economics	Assignment price, reimbursements, deposits, expenses, tax reserves and payment instructions
Publicity	No names, logos, call notes or deal announcement without written permission
Post-close	Archive final set, request feedback/referrals and update conversion/cost data

Three closing outcomes

Assignment: the buyer steps into the land position and funds remaining diligence/closing.

Buyer-backed continuation: buyer funds a defined next proof and receives exclusivity before final transfer.

Kill: option expires or is terminated within the capped downside; evidence and rejection reasons improve the next search.

SUCCESS METRIC
A clean $10,000 loss inside a planned cap can be a better operating result than a forced land closing or a $100,000 rescue attempt. Judge the process by whether it bought decisive information cheaply and protected your ability to try again.

FOUNDER OPERATING CADENCE DURING LAW SCHOOL

Design the deal around the calendar you actually have

Block	Time	Work
Monday async	45-60 min	Review weekly scout, approve primary research and kill stale tasks
Wednesday calls	60-90 min	Batch buyer, county, utility, seller and vendor calls
Friday synthesis	45-60 min	Upload notes, update gates, decide next cheapest test
Weekend deep block	2-4 hours only when needed	Parcel review, counsel materials, negotiation prep or data room
Monthly retro	60 min	Costs, hours, false positives, call completion and workflow changes

Calendar covenants

One live paid-control position until first monetization.

Target 6-10 hours per week during term. Delegate, defer or kill a task that needs 15+ hours for three consecutive weeks.

No option expiry, hard deposit conversion, hearing or planned closing within 21 days of final exams or a major journal/moot-court deadline.

Avoid same-day client service promises while in school; this is an asset process, not an always-on consultancy.

Travel only after the parcel survives the desktop and a specific visit objective is written.

SOLO-FOUNDER ADVANTAGE
One controlled position can be managed asynchronously. The automation should compress research and prepare your calls, but it should never create more live deals than your school schedule can protect.

WEEKLY DASHBOARD AND STOP RULES

Measure truth velocity, not activity theater

Metric	First-90-day target	Stop/change trigger
Buyer discovery	8-12 completed; requirement card updated	No consistent buyer class or proof threshold
Node leads	20 current, source-backed; one primary/two backups	Mostly stale/proxy signals or poor closeability
Exact APNs	20-40 screened; 3-6 APN-qualified	No reachable owner, access or ordinary-use downside
Written paths	Utility + planning process for primary	No plausible utility or use path
Seller	Authorization/exclusivity or option terms	Hard money, short clock, no assignment/cooperation
Buyer site test	2 qualified reviews or 1 funded next proof	20 qualified outreaches with no substantive engagement
Cash	<= $2,500 until prerequisites; <= $15,000 pre-sponsor	Any spend that exceeds cap or lacks kill criterion
Founder time	6-10 hours/week	>15 hours for 3 weeks or missed academic obligations

Portfolio kill reasons to track

Wrong owner or non-acquirable land; access/assemblage failure; seller uncooperative.

Utility will not engage without a customer profile you cannot supply; no service path on buyer window.

Use ban, politically unrealistic rezoning, water/cooling fatality or environmental/ROW obstacle.

Buyer requirement mismatch, price basis too high, easy substitute parcels or evidence cannot transfer.

Legal/marketing structure requires a license/partner or expense that destroys the model.

KILL IS DATA
For every killed parcel save the gate, source, cost, elapsed days, earliest missed signal and search-rule change. The automation becomes defensible by learning what not to pursue.

YOUR FIRST TEN WORKING DAYS

The exact founder action queue

Day	Founder action	AI/preparation	Success / stop
1	Approve Requirement Card v0 and legal scope	Create templates and source registry	One narrow buyer hypothesis
2	Send fixed-fee scope to 2-3 Arizona commercial land lawyers	Draft comparison sheet	Quote and issue coverage
3	Select 12 discovery targets and 5 warm channels	Research current role/signal; draft messages	Verified contact paths
4	Book first 4 buyer calls	Generate briefs and capture forms	Calls scheduled
5	Review refreshed Arizona node list	Run current source/change scan	20 node leads; no capacity claims
6	Complete 2 buyer conversations	Update requirement card	At least one rejection criterion learned
7	Choose top 3 nodes to parcelize	Fetch county parcel adapters	Exact APN work begins
8	Resolve county GIS/assessor ambiguities	Build APN and adjacency tables	10+ exact parcels
9	Complete 2 more buyer calls	Re-rank parcels against current card	Card v0.2 or explicit disagreement
10	Select one primary and two backup parcel groups	Generate fatal-screen plan and call packet	CALL SPRINT / $0 option fee

SPEND DURING DAYS 1-10
Only fixed-scope counsel, essential data and limited communication/travel inside the $2,500 cumulative cap. No option consideration, consultant capacity report, utility deposit, national travel, software build or paid lead list.

90-DAY OPERATING PLAN

Outputs, gates and founder decisions

Phase	Required outputs	Founder decision
Days 1-15	Counsel memo/plan; Requirement Card v0.2; source registry; 20 nodes; 4-6 buyer calls	Is the model lawful and is the search box coherent?
Days 16-30	20-40 exact APNs; fatal screens; one primary/two backups; owner and utility candidates	Which parcel deserves calls, and which are killed?
Days 31-45	Planning/utility/water call records; owner dialogue; written follow-ups	Is there a studyable path and receptive seller?
Days 46-60	Seller authorization/access/exclusivity; title desktop; anonymous buyer fit check	Negotiate option or remain in soft control?
Days 61-75	Counsel-led option terms; permissioned data room; buyer questions	Is control truly transferable and long enough?
Days 76-90	Executed control only if gates clear; two buyer reviews or one proof budget; retrospective	Advance, extend, assign, hold or kill?

Day 90 go/no-go

GO: counsel-approved structure, validated buyer card, exact APN, seller-authorized control path, written utility/use process and substantive buyer engagement.

HOLD: promising parcel but one answer remains; no money unless a short, explicit test resolves it.

KILL/REPLACE: seller terms, utility/use path, buyer fit, legal structure or founder schedule destroys the asymmetry.

NO FORCED TIMELINE
Do not set 'buy land by year-end' as the operating goal. Set 'reach controlled, buyer-reviewable position without exceeding $15,000' as the gate. Calendar pressure is exactly how a seller's deadline becomes your capital problem.

ARIZONA CURRENT-STATE OVERLAY

Facts the automation must refresh before every deal

Fact as of 31 Aug 2026	Operating consequence	Source
APS shows 2025 peak load of 8.7 GW and an uncommitted queue of 19 GW; it says existing infrastructure cannot serve every request	A proximity screen cannot substitute for a credible, customer-backed utility process	W1
ACC says APS/SRP interest exceeds current capacity and utilities are separating speculative requests	Buyer credibility, load profile, financial support and milestones matter before utility work	W2
SRP LCIP determines infrastructure; large customers pay upgrades upfront; E-67 uses >=20 MW and 80% minimum billing	A land option alone will not enter or fund the mature service process	W3
ACC approved a cooperative large-load framework in August 2026 with customer-funded infrastructure and transmission costs	Rural co-ops are not a cheap capacity shortcut; process may be clearer but sponsor strength matters	W4
APS XHLF requires >=5 MW and 92% load factor under the current tariff; APS has proposed major extra-large-user changes	Tariff/rate assumptions must be rechecked on the day of underwriting	W5-W6
Arizona parcel data are county-specific; AZGeo catalogs county layers	Build county adapters and verify assessor/recorder authority rather than using a statewide point polygon	W7
ADWR maintains current well, basin and water-resource GIS	Automate early water screens, then escalate rights/provider/hydrology	W8

MATERIAL CHANGE FROM JULY
The prior screen's rural political and co-op assumptions are stale in places. The August cooperative framework and intervening local actions reinforce the need for daily source dates and written verification before money.

LEGAL AND PROFESSIONAL GUARDRAILS

Issue spotting only - obtain licensed advice

Issue	Current point	Founder rule
Broker/option activity	A.R.S. 32-2101 defines sale broadly and includes options; 32-2121 exemptions have conditions	Get a written opinion on the exact LLC conduct, frequency and compensation [W13-W14]
Wholesaling	A.R.S. 44-5101 expressly covers residential property under five units	Do not assume commercial industrial assignments are cleared; counsel sets disclosures [W15]
Foreign LLC	A.R.S. 29-3905 lists isolated transactions and owning property without more, but preserves other regulation/tax	Ask whether Synchronicity or an SPV must register in Arizona [W16]
Claims	An option does not create utility capacity, entitlement or buyer interest	Use exact evidence date and say 'controlled under option,' not 'powered'
Reports	Copyright, ownership, reliance and assignment are different rights	Request express buyer reliance/assignment or disclose limitation
Outside capital	Passive interests, notes, promotes or transaction compensation may trigger securities/broker issues	No blind fund or casual investor SPV without securities, tax and corporate counsel
Access/environment	Testing can create insurance, indemnity, restoration and environmental exposure	Use counsel-approved access and qualified professionals

NON-NEGOTIABLE LANGUAGE
Do not say powered, power available, utility-approved, shovel-ready, fully entitled, buyer-ready or energize-by unless a current parcel/load-specific document supports the exact statement. A disclaimer does not cure an unsupported pitch.

RISK REGISTER

Likelihood is not estimated; control the exposure and next test

Risk	Early signal	Control	Kill/transfer trigger
No utility path	Utility requires named customer/credit or lacks timeline	Buyer discovery first; seller authorization; no study spend	Buyer funds path or kill
Option clock	Seller wants short term or large hard fee	Soft exclusivity; extensions; school calendar covenant	Walk away
Substitute parcel	Buyer sees many similar sites	Demand-specific scarcity, price discipline, exact evidence	Do not extend without engagement
Title/access	Landlocked, easement, split authority or liens	Recorder/title desktop before option fee	Uncurable or expensive cure
Use/politics	Discretionary rezoning, opposition, referendum or water fight	Written path, local counsel, low-water narrative	Buyer will not carry risk
Misrepresentation	Pressure to describe 'capacity' or buyer interest	Claim IDs, scripts, review and correction log	Stop outreach
Licensing/securities	Success fee for another, passive investor money or public syndication	Written counsel structure	License/partner or stop
Founder overload	Missed calls, stale evidence, academic conflict	One live deal; 6-10 hours/week	Defer, delegate or kill
Sunk cost	Extending because prior spend feels unrecoverable	Precommitted gates and written retrospective	Do not rescue

BASE-RATE REALITY
Most node leads should die. Many APNs will never reach a seller conversation, most seller conversations will not produce acceptable control, and some options will expire. The model survives only if each failure is cheap and the occasional buyer-backed transfer is large enough to fund the next cycle.

Method

Compared the four prior strategy reports and the Arizona workpapers, preserving conflicts rather than averaging them.

Rechecked mutable utility, regulator, parcel, water, environmental and statutory sources through 31 August 2026.

Converted the option-led recommendation into a demand-first state machine, capital-gated founder workflow and AI system design.

Used management scenarios only where no quote or transaction exists; labeled them illustrative and not forecasts.

Still unknown

The exact first parcel, owner, legal description, title/access and seller terms.

A qualified buyer's live requirement, price basis, timing and willingness to fund the next proof.

The serving utility and parcel/load-specific delivery, supply, upgrade, cost and timeline path.

Current zoning/use, water/cooling, fiber-route, environmental and political facts for a selected APN.

Arizona counsel's conclusion on the exact licensing, disclosure, entity, escrow, tax and marketing structure.

FINAL DECISION
Begin now - but begin with calls, source architecture and exact-APN conversion, not an option payment. The first parcel is the output of a demand-shaped and legally structured search. The first option is earned only after the parcel survives fatal screens and a buyer class values the next proof. The first expensive certainty should be funded by the larger company that can use it.
